

The Nearby Field Galaxy Survey, I

Surface photometry of a representative sample of nearby galaxies

An atlas of images and radial profiles

(c)1998 NFGS; R.A. Jansen, M. Franx, D.G. Fabricant, N. Caldwell

Our U,B,R photometry was obtained with the CCD camera at the 48" telescope of the E.L. Whipple observatory at Mt. Hopkins, AZ. The galaxy images and profiles on this poster were placed from left to right in order of their morphological (Hubble) type and from top to bottom for each type in order of decreasing B-filter luminosity. In the images North is up and East is to the left. The image scale is indicated by a scale bar, 1 minute of arc in length.
