Strong and Electroweak Matter 2010
McGill University, Montreal, Canada

Dense relativistic matter

- Dense relativistic matter is common inside compact stars
  - Electrons in white dwarfs

    $T \ll m \lesssim \mu \quad (i.e., T \lesssim 1$ keV & $\mu \simeq 1$ MeV)
  - Neutrons of nuclear matter

    $T \ll m \lesssim \mu \quad (i.e., T \lesssim 10$ MeV & $\mu \simeq 1$ GeV)
  - Electrons inside stellar nuclear matter

    $m \lesssim T \ll \mu \; (i.e., T \lesssim 10$ MeV & $\mu \simeq 100$ MeV)
  - Dense quark matter in stellar cores (if formed)

Dense relativistic matter

- Dense relativistic matter is common inside compact stars
  - Electrons in white dwarfs

    $T \ll m \lesssim \mu \quad (i.e.,\ T \lesssim 1\ \text{keV} \ \&\ \mu \simeq 1\ \text{MeV})$

  - Neutrons of nuclear matter

    $T \ll m \lesssim \mu \quad (i.e.,\ T \lesssim 10\ \text{MeV} \ \&\ \mu \simeq 1\ \text{GeV})$

  - Electrons inside stellar nuclear matter

    $m \lesssim T \ll \mu \ (i.e.,\ T \lesssim 10\ \text{MeV} \ \&\ \mu \simeq 100\ \text{MeV})$

  - Dense quark matter in stellar cores (if formed)

ASU Arizona State University

General idea

- Topological current in relativistic matter in a magnetic field (3+1 dimensions)

$$\langle\bar{\psi}\gamma^3\gamma^5\psi\rangle = \frac{eB}{2\pi^2}\mu$$

(free theory!)

[Metlitski, Zhitnitsky, PRD **72**, 045011 (2005)]

- Should there be a dynamical "mass" Δ, associated with this condensate?

$$\mathcal{L} = \mathcal{L}_0 + \mathcal{L}_\Delta \quad \text{where} \quad \mathcal{L}_\Delta \simeq \Delta\bar{\psi}\gamma^3\gamma^5\psi$$

- Note: Δ=0 is not protected by any symmetry

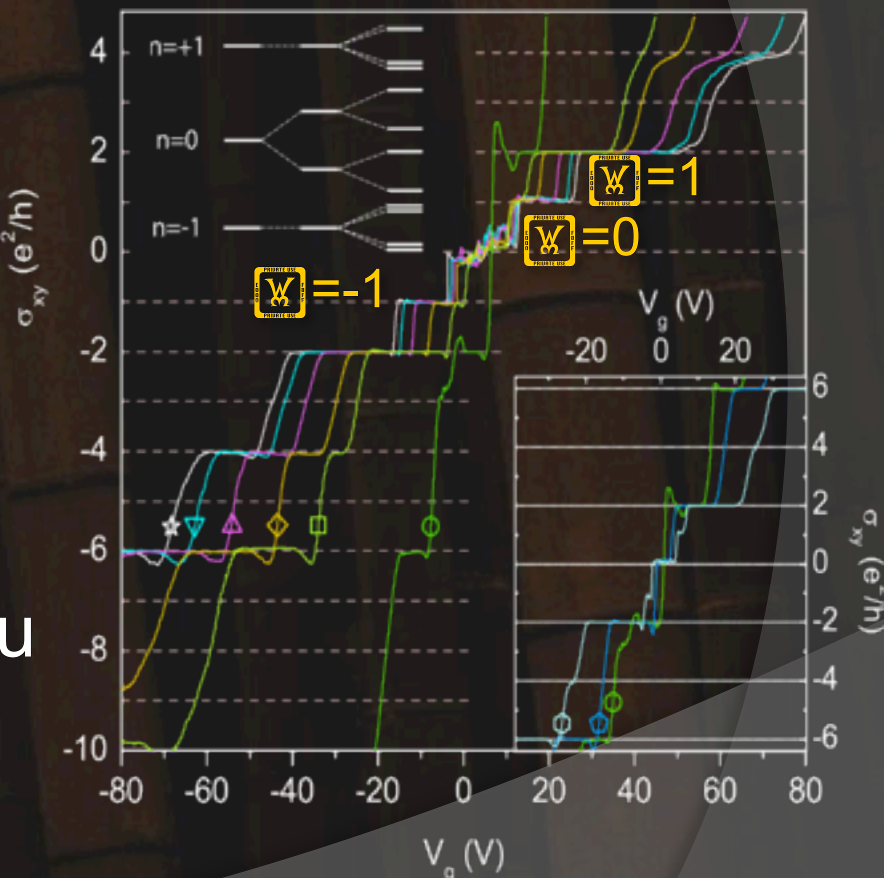
Lesson from graphene

- Dynamics of Quantum Hall Effect in graphene (≈ QED in 2+1 dimensions)
  - Parity and time-reversal odd Dirac mass

$$\Delta \sim \langle \bar{\Psi} \gamma^3 \gamma^5 \Psi \rangle$$

[Gorbar, Gusynin, Miransky, I.S., PRB **78**, 085437 (2008)]

- Δ describes the 0^{th} plateau in Quantum Hall effect in graphene



Zhang et al., PRL **96,** 136806 (2006)

Model

- Lagrangian density:

$$\mathcal{L} = \bar{\psi}\left(iD_\nu + \mu_0\delta_\nu^0\right)\gamma^\nu\psi + \frac{G_{\text{int}}}{2}\left[\left(\bar{\psi}\psi\right)^2 + \left(\bar{\psi}i\gamma^5\psi\right)^2\right]$$

- The dimensionless coupling is

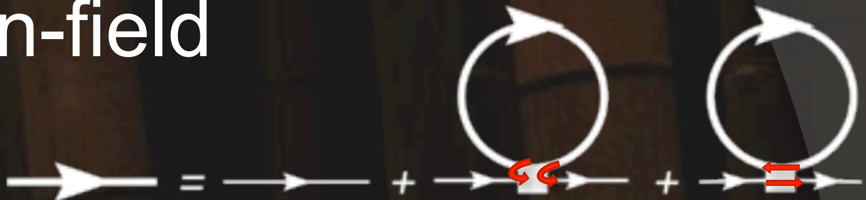
$$g \equiv G_{\text{int}}\Lambda^2/(4\pi^2) \ll 1$$

- Magnetic field is inside $D_\nu = \partial_\nu - ieA_\nu$

  where $A_\nu = xB\delta_\nu^2$ (Landau gauge)

Approximation

- Gap equation in mean-field approximation:



$$G^{-1}(u,u') = S^{-1}(u,u') - iG_{\text{int}}\left\{G(u,u) - \gamma^5 G(u,u)\gamma^5 - \text{tr}[G(u,u)] + \gamma^5\,\text{tr}[\gamma^5 G(u,u)]\right\}\delta^4(u-u')$$

where

$$iG^{-1}(u,u') = \Big[(i\partial_t + \mu)\gamma^0 - (\boldsymbol{\pi}\cdot\boldsymbol{\gamma}) - \pi^3\gamma^3 + i\tilde{\mu}\gamma^1\gamma^2 + \Delta\gamma^3\gamma^5 - m\Big]\delta^4(u-u')$$

and

$$iS^{-1}(u,u') = \left[(i\partial_t + \mu_0)\gamma^0 - (\boldsymbol{\pi}\cdot\boldsymbol{\gamma}) - \pi^3\gamma^3\right]\delta^4(u-u')$$

Vacuum state

- Magnetic catalysis (spontaneous generation of a nonzero Dirac mass even at $g \ll 1$):

$$m_0^2 = \frac{1}{\pi l^2} \exp\left(-\frac{\Lambda^2 l^2}{g}\right) \quad \text{where} \quad l = 1/\sqrt{|eB|}$$

(along with $\mu = \mu_0$)

[Gusynin, Miransky, I.S., PRL **73**, 3499 (1994); PLB **349**, 477 (1995)]

- The solution exists for $\mu_0 < m_0$, although it will be less stable than the normal state ($m = 0$) already for $\mu_0 \gtrsim m_0/\sqrt{2}$ [Clogston, PRL **9**, 266 (1962)]

"Abnormal" normal ground state

- The gap equation allows another solution,

$$\mu \simeq \mu_0 \;\; \text{and} \;\; \Delta \simeq g\mu_0 eB/\Lambda^2$$

- This solution is almost independent of temperature when T [illegible] μ
- This is the normal ground state since its symmetry is same as in the Lagrangian
- Besides, there is no trivial solution Δ=0

Change of ground state

- The free energy in the state with $m \neq 0$ (broken symmetry)

$$\Omega_m \simeq -\frac{m_0^2}{2(2\pi l)^2}\left(1 + (m_0 l)^2 \ln|\Lambda l|\right)$$

- The free energy in the normal state, $\Delta \neq 0$

$$\Omega_\Delta \simeq -\frac{\mu_0^2}{(2\pi l)^2}\left(1 - g\frac{|eB|}{\Lambda^2}\right)$$

- So, indeed symmetry is restored for $\mu > \mu_c$,

$$\mu_c \simeq m_0/\sqrt{2}$$

Physical meaning of Δ

- The dispersion relation of quasiparticles:

$$\omega_{n,\sigma} = -\mu \pm \sqrt{[k_3 + \sigma\Delta]^2 + 2n|eB|}$$

where $\sigma = \pm 1$ is the chirality

- Longitudinal momenta of opposite chirality fermions are *shifted, i.e.,* $k_3 \to k_3 \pm \Delta$
- All Landau levels ($n \neq 0$) are affected by Δ

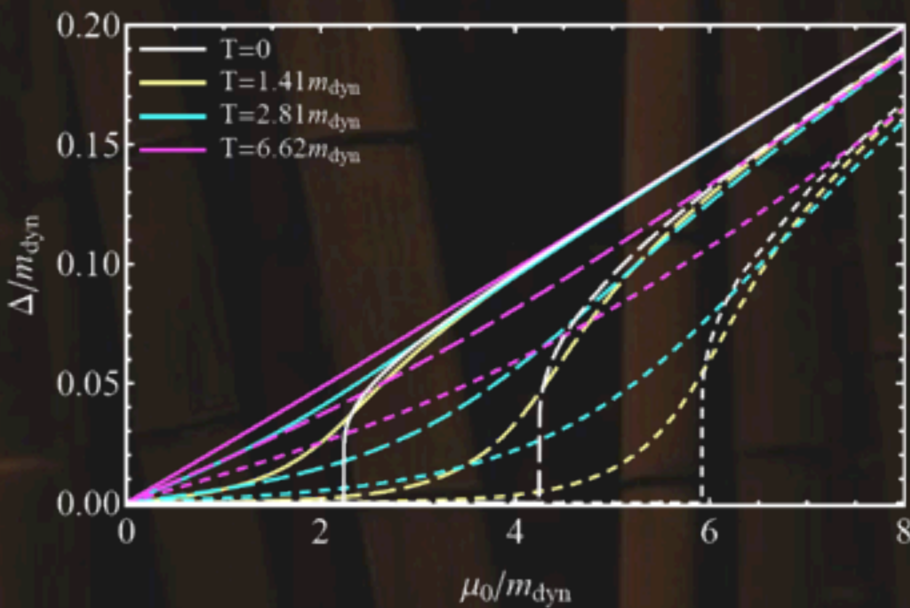
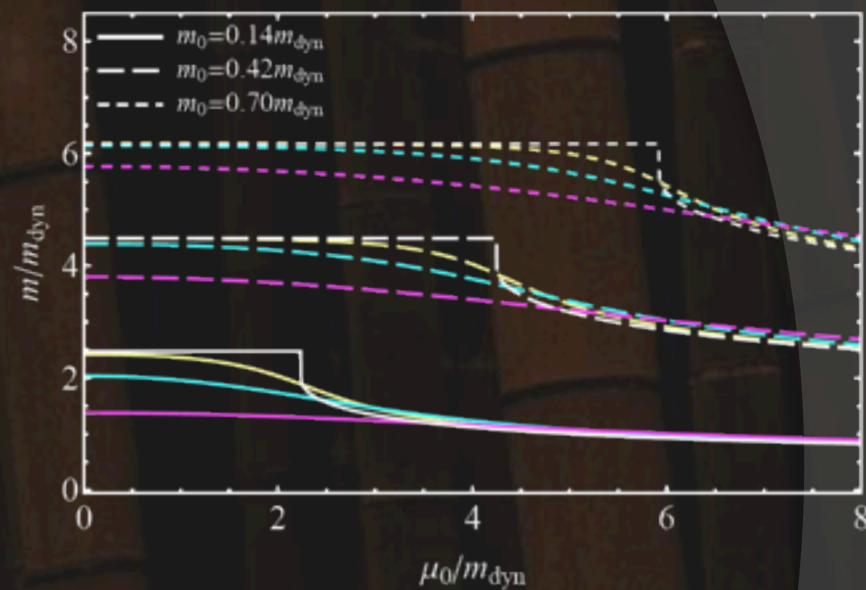
T≠0 results





- These are smoothed versions of the T=0 results
- The dependence [illegible]-[illegible]$_0$ versus [illegible]$_0$ (not shown) at T≠0 is similar to Δ versus [illegible]$_0$ (shown)

Induced axial current

- The axial current in the ground state is

$$\langle \bar{\psi}\gamma^3\gamma^5\psi\rangle = \boxed{\frac{eB}{2\pi^2}\mu} - \frac{|eB|}{2\pi^2}\Delta - \frac{|eB|}{\pi^2}\Delta\sum_{n=1}^{\infty}\kappa(\sqrt{2n|eB|},\Lambda)$$

- In addition to the topological contribution, $\frac{eB}{2\pi^2}\mu$ there are dynamical ones [illegible] Δ
- An equivalent result is also obtained in the Pauli-Villars regularization
- Note: on the solution to the gap equation:

$$\langle j_5^3(u)\rangle = \frac{2\Delta}{G_{\text{int}}} = \frac{\Delta}{2\pi^2}\frac{\Lambda^2}{g}$$

Potential implications

- Physical properties to be affected
  - transport
  - emission
    (must be sensitive to anisotropy and/or CP violation)
- Specific physical systems
  - Compact stars
    - Quark stars (quarks)
    - Hybrid stars (quarks, electrons)
    - Neutron stars (electrons)
    - White dwarfs (electrons)
  - Heavy ion collisions [Kharzeev & Zhitnitsky, NPA **797**, 67(2007), Kharzeev, McLerran & Warringa, NPA 803, 227 (2008), …]

Pulsar kicks

- The dynamical chiral shift parameter is driven by chemical potential (T [illegible] μ)

$$\Delta \simeq g\mu_0 eB/\Lambda^2$$

  and is almost independent of temperature
- This creates an anisotropy in the distribution of left-handed quarks/electrons
- The anisotropy is transferred to left-handed neutrinos by elastic scattering
- Pulsar gets a kick when neutrinos escape

Supernova explosions

- Because of the robustness of the axial currents at finite temperatures, even supernova explosions may be affected

- A small early-time neutrino asymmetry may *facilitate* explosions and give a kick at the same time, e.g., see

  [Fryer & Kusenko, Astrophys. J. Supp. **163**, 335 (2006)]

Summary

- $\mu < \mu_c$: Chiral symmetry is broken in the ground state (magnetic catalysis)
- $\mu > \mu_c$: Normal ground state of dense relativistic matter in a magnetic field is characterized by
  - Chiral shift parameter (may have dramatic implications for stars)
  - Axial current along the field (physical effects are not obvious)
  - No solution with vanishing Δ exists

Outlook

- Calculation of neutrino emission/diffusion in the state with a chiral shift parameter (work in progress)
- Transport properties of the normal state with nonzero chiral shift parameter
- The fate of the induced axial current in the renormalized models (work in progress)
- Modification of the chiral magnetic effect due to "vector-like" Δ in heavy ion collisions

  [Fukushima, Kharzeev & Warringa, PRD **78**, 074033 (2008)]
