

Magnetism and chirality in QCD

Igor Shovkovy Arizona State University

Role of chirality in QCD

Approximate chiral symmetry (& its breaking)

- → natural order parameter
- \rightarrow dynamical origin of nucleon masses
- → spectrum of light mesons
- \rightarrow structure of the chiral perturbation theory
- → anomalous properties

 \rightarrow ...

Role of magnetism in QCD

- Magnetized quark matter may exist inside compact stars
 - -10^{10} to 10^{16} G (10 keV to 10 MeV)
- Magnetized quark-gluon plasma is produced in heavy ion collisions ($\Delta t \approx 10^{-24}$ s) -10^{18} to 10^{19} G (~100 MeV)
- Magnetic field is a useful probe of nonperturbative QCD properties -10^{21} G (~1 GeV)

MAGNETIZED QCD VACUUM

[Miransky & Shovkovy, Physics Reports 576 (2015) pp. 1-209]

May 12, 2015

Landau spectrum at B≠0

- Dirac equation with massless fermions $\left[i\gamma^{0}\partial_{0} - i\vec{\gamma}\cdot\left(\vec{\nabla} + ie\vec{A}\right)\right]\Psi = 0 \qquad E_{n}(p_{3})$
- Energy spectrum

$$E_n^{(3+1)}(p_3) = \pm \sqrt{2n|eB|} + p_3^2$$

$$s = \pm \frac{1}{2} \text{ (spin)}$$

where $n = s + k + \frac{1}{2}$
 $k = 0, 1, 2, \dots \text{ (orbital)}$

Occupied

Magnetic catalysis: idea

• Low-energy fermion dynamics is dimensionally reduced

$$D \rightarrow D - 2$$

• Nonzero density of states at E = 0

$$\frac{dn}{dE}\Big|_{E \to 0} = \frac{|eB|N_f}{4\pi^2}$$

• Attractive interaction → symmetry breaking (reminiscent of superconductivity...)

[Gusynin, Miransky, Shovkovy, Phys. Rev. Lett. 73 (1994) 3499]

I Universality of magnetic catalysis

• Input

- Spin-1/2 charged particles and B \neq 0
- Attractive particle-antiparticle interaction
- Output
 - Dimensional reduction $D \rightarrow D-2$ @ low energies
 - particle-antiparticle bound states form
 - Symmetry breaks down
 - Dynamical mass is generated

Anisotropic confinement in QCD

• Low-energy gluodynamics ($p << m_{dvn}$):

$$L \approx \frac{1}{2} \sum_{a=1}^{N_c^2 - 1} \left(\vec{E}_{\perp}^a \cdot \vec{E}_{\perp}^a + \varepsilon E_z^a E_z^a - \vec{B}_{\perp}^a \cdot \vec{B}_{\perp}^a - B_z^a B_z^a \right)$$

where the chromo-dielecric constant is given by

$$\varepsilon \approx 1 + \frac{\alpha_s}{6\pi} \sum_{f=1}^{N_f} \frac{|q_f B|}{m_f^2} >> 1$$

The new confinement scale is

Note: $\lambda_{\text{OCD}} \ll \Lambda_{\text{OCD}}$

$$\lambda_{\text{QCD}} \approx m_d \left(\frac{\Lambda_{\text{QCD}}}{\sqrt{|eB|}}\right)^{\frac{11N_c - 2N_f}{11N_c}}$$

[Miransky & I.S., Phys. Rev. D 66 (2002) 045006]

Magnetic catalysis in QCD (lattice)

(Inverse) Catalysis at T≠0?

[Bali et al., Phys. Rev. D86, 071502 (2012)]

ASJ $B \neq 0$: Chiral separation effect

• Axial current density induced by the chemical potential

$$\left\langle \vec{j}_{5} \right\rangle_{\text{free}} = \frac{e\vec{B}}{2\pi^{2}}\mu$$
 (free theory!)

[Vilenkin, Phys. Rev. D **22** (1980) 3067] [Metlitski & Zhitnitsky, Phys. Rev. D **72**, 045011 (2005)] [Newman & Son, Phys. Rev. D **73** (2006) 045006]

• This result is connected to the chiral anomaly relation ($\mu \rightarrow e\Phi$)

$$\partial_z \left\langle j_5^z \right\rangle_{\text{free}} = \frac{e}{2\pi^2} B_z \partial_z \left(e\Phi \right) = -\frac{e^2}{2\pi^2} B_z E_z$$

• However, axial current gets radiative corrections

- LLL is spin polarized and chirally asymmetric states with $p_3 < 0$ (and $s=\downarrow$) are R-handed
 - states with $p_3 > 0$ (and $s = \downarrow$) are L-handed
- This indeed implies axial current density

Spin vs. orbital motion

 Helicity/chirality of massless (ultrarelativistic) fermions is (≈) conserved

• Chirality does not change in elementary QED interactions

- What is the effect of interactions?
- To preserve chirality, particle momenta have to "flip" whenever the spin "flips"
- B-field \Rightarrow preferred spin orientation $s = \downarrow$
- Interactions \Rightarrow chiral asymmetry in hLLs

L-handed prefer $s = \downarrow$ and, thus, $p_3 < 0$ R-handed prefer $s = \downarrow$ and, thus, $p_3 > 0$

• Anticipated outcome: L- & R-handed Fermi surfaces shift in p_3 direction p_3 L-handed

п

Chiral shift at low energies

• Ground state expectation value of the axial current (CSE)

$$\left\langle \bar{\psi}\gamma^{3}\gamma^{5}\psi \right\rangle = \frac{eB}{2\pi^{2}}\mu \quad \text{with} \quad \vec{B} = (0,0,B)$$

[Metlitski & Zhitnitsky, Phys. Rev. D 72, 045011 (2005)]

should induce a dynamical (chiral shift) parameter Δ associated with the condensate,

$$\delta L = \Delta \,\overline{\psi} \,\gamma^3 \gamma^5 \psi$$

[Gorbar, Miransky, I.S., Phys. Rev. C 80, 032801(R) (2009)] (Δ =0 is not protected by any symmetry)

• The equation for the chiral shift

$$\Delta = -\frac{1}{2}G_{\rm int} \left\langle \bar{\psi}\gamma^3\gamma^5\psi \right\rangle \approx -\frac{G_{\rm int}eB}{4\pi^2}\mu$$

Chiral shift @ Fermi surface

- Chirality is \approx well-defined at Fermi surface $(|p_3| \gg m)$
- L-handed Fermi surface:

$$n > 0: \quad p_{3} = +\sqrt{\left(\sqrt{\mu^{2} - 2n\left|eB\right|} - s_{\perp}\Delta\right)^{2} - m^{2}}$$
$$p_{3} = -\sqrt{\left(\sqrt{\mu^{2} - 2n\left|eB\right|} + s_{\perp}\Delta\right)^{2} - m^{2}}$$

• R-handed Fermi surface:

$$n > 0: \quad p_{3} = -\sqrt{\left(\sqrt{\mu^{2} - 2n\left|eB\right|} - s_{\perp}\Delta\right)^{2} - m^{2}}$$
$$p_{3} = +\sqrt{\left(\sqrt{\mu^{2} - 2n\left|eB\right|} + s_{\perp}\Delta\right)^{2} - m^{2}}$$

[Gorbar, Miransky, Shovkovy, Phys. Rev. D 83, 085003 (2011)]

p₃

p₃

KITPC program "sQGP and Extreme QCD", Beijing, China

N

N

• The result has the form

$$\bar{\Sigma}^{(1)}(p) = \gamma^3 \gamma^5 \Delta(p) + \gamma^0 \gamma^5 \mu_5(p)$$

Near Fermi surface $(p_0 \rightarrow 0, |\mathbf{p}| \rightarrow p_F)$

1

$$\Delta(p) \approx \frac{\alpha eB \mu}{\pi m^2} \left(\ln \frac{m^2}{2 \mu \left(\left| \mathbf{p} \right| - p_F \right)} - 1 \right)$$
$$\mu_5(p) \approx -\frac{\alpha eB \mu}{\pi m^2} \frac{p_3}{p_F} \left(\ln \frac{m^2}{2 \mu \left(\left| \mathbf{p} \right| - p_F \right)} - 1 \right)$$

[Gorbar, Miransky, Shovkovy, Wang, Phys. Rev. D 88, 025043 (2013)]

QED in strong field

Self-energy in the Landau-level representation:

$$\overline{\Sigma}(p) = 2e^{-p_{\perp}^{2}l^{2}} \sum_{n=0}^{\infty} (-1)^{n} \left(-\gamma^{0} \delta \mu_{n} - \gamma^{3} \gamma^{5} \Delta_{n} - \gamma^{0} \gamma^{5} \mu_{5,n} + m_{n} + \dots\right) \left[P_{-}L_{n} - P_{+}L_{n-1}\right] - \dots$$

where $\delta \mu_n$, Δ_n , $\mu_{5,n}$, ... are "projections" of the self-energy on the *n*th Landau level,

$$\Delta_{n}(p_{0},p_{3}) = \frac{(-1)^{n}l^{2}}{8\pi} \int d^{2}p_{\perp}e^{-p_{\perp}^{2}l^{2}} \left[L_{n} + L_{n+1}\right]Tr[\gamma^{0}\overline{\Sigma}(p)]$$

where

 $\overline{\Sigma}(p) = -4i\pi\alpha \int \frac{d^4k}{\left(2\pi\right)^4} \gamma^{\mu} \overline{S}(k)\gamma^{\nu} D_{\mu\nu}(k-p)$

[Gorbar, Miransky, Shovkovy, Wang, Phys. Rev. D 88, 025043 (2013)]

QED in strong field: Δ_n

QED in strong field: $\mu_{5,n}$

May 12, 2015

QED in strong field: δp_3

In QED:

$$\frac{\alpha |eB|}{\mu} \approx 0.4 \left(\frac{B}{10^{18} \text{G}}\right) \left(\frac{100 \text{ MeV}}{\mu}\right) \text{MeV/c}$$

In QCD:

$$\frac{\alpha_s |eB|}{\mu} \approx 10 \left(\frac{B}{10^{18} \text{ G}}\right) \left(\frac{400 \text{ MeV}}{\mu}\right) \text{MeV/c}$$

• Neutrinos equilibrate with the "flow" of Lhanded fermions via

• An asymmetric L-handed Fermi surface with

$$\delta p_3 \sim \alpha \; |eB|/\mu$$

should scatter v_e 's more preferably in the direction of the field

May 12, 2015

ASJNeutrinos from protoneutron star

• Sizeable kick carry momenta of order

 $(1000 \text{ km/s}) \times 1.4M_{\text{Sun}} \approx 3 \times 10^{36} \text{ kg} \cdot \text{m/s}$ $\approx 9 \times 10^{44} \text{ J/c}$ $\approx 6 \times 10^{57} \text{ MeV/c}$

i.e., average momentum asymmetry per neutrino should be about

$$\frac{6 \times 10^{57} \text{ MeV/c}}{4 \times 10^{57}} \approx 1.5 \text{ MeV/c}$$

• Total momentum carrier by L-handed fermions

- QED (B=10¹⁸ G and µ=100 MeV): $P \sim N \,\delta p \sim 10^{57} \,\frac{\alpha |eB|}{\mu} \sim (70 \text{ km/s}) \times 1.4 M_{\text{Sun}}$

- QCD (B=10¹⁸ G and µ=400 MeV):

$$P \sim N \,\delta p \sim 10^{57} \,\frac{\alpha_s \left| eB \right|}{\mu} \sim (1700 \text{ km/s}) \times 1.4 M_{\text{Sun}}$$

• Pulsar kicks? Possible, but questions remain...
